Play Store Data Analysis

A visual exploration of app categories, adoption, ratings and review activity.

Project overview

This Power BI portfolio project brings app-level metrics into a multi-page report. It compares the distribution of apps, installation volume, review activity and ratings to help readers explore the supplied Play Store dataset.

168bn	5bn	9,639	444.15K
Total installs	Total reviews	Total apps	Avg Review

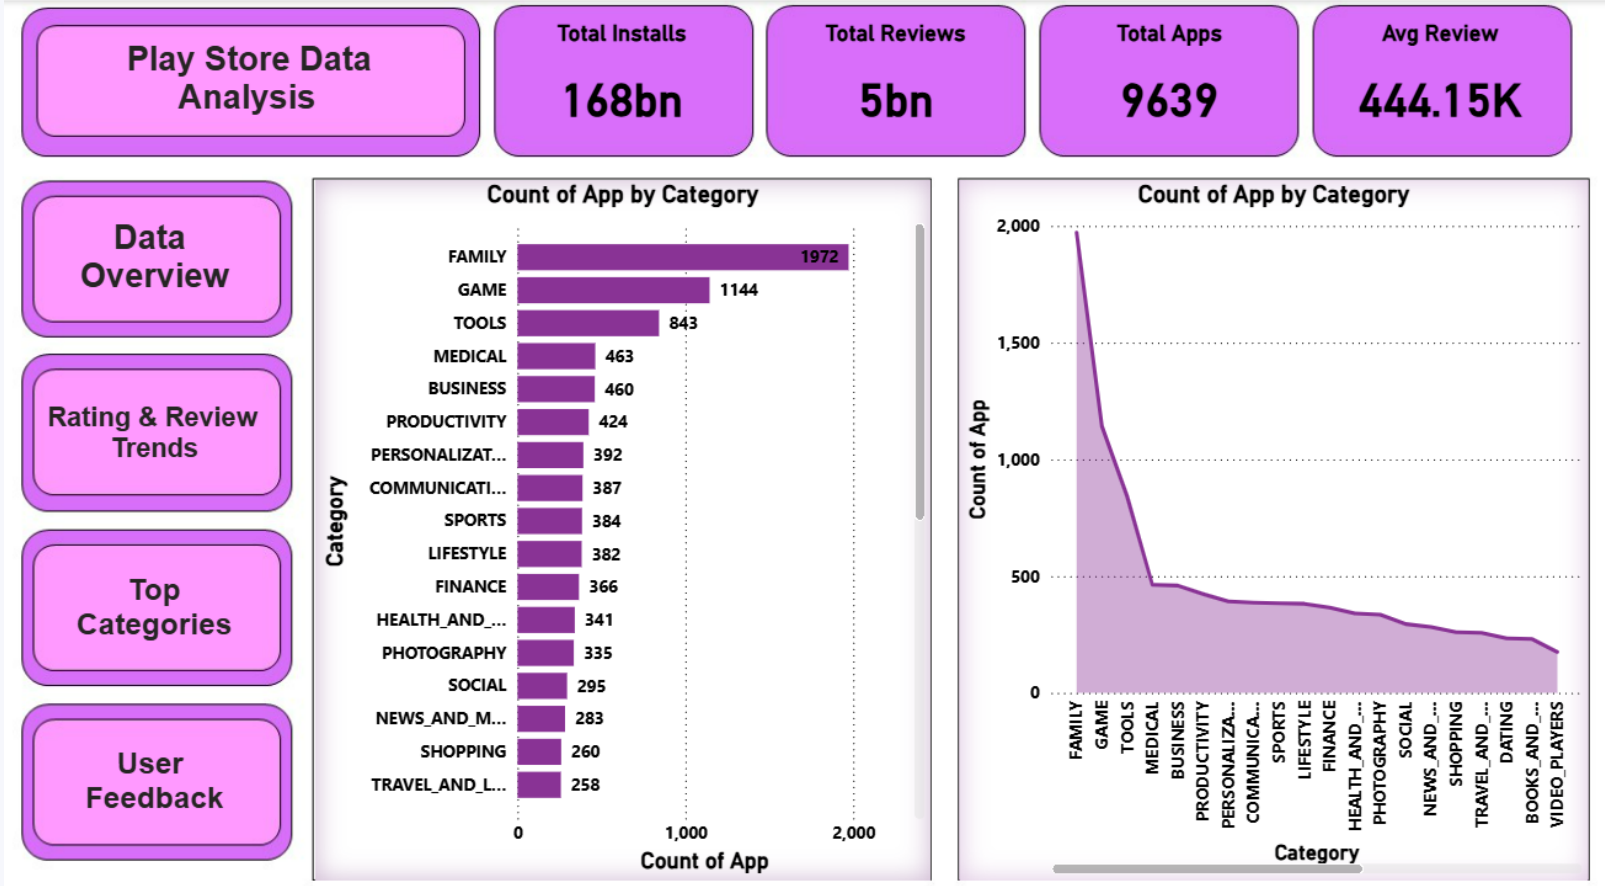

What this report explores

01 App distribution by category 02 Category installs and ratings
03 Top apps and rating distribution 04 Cost and review composition
05 Ratings compared with review volume

Reading note. Figures above reproduce the displayed dashboard cards and are rounded. They are dataset aggregates, not current market totals or unique users. Measure formulas and the source data were not audited; the denominator of Avg Review is unverified.

01 / Data overview

Category coverage and the distribution of app records.

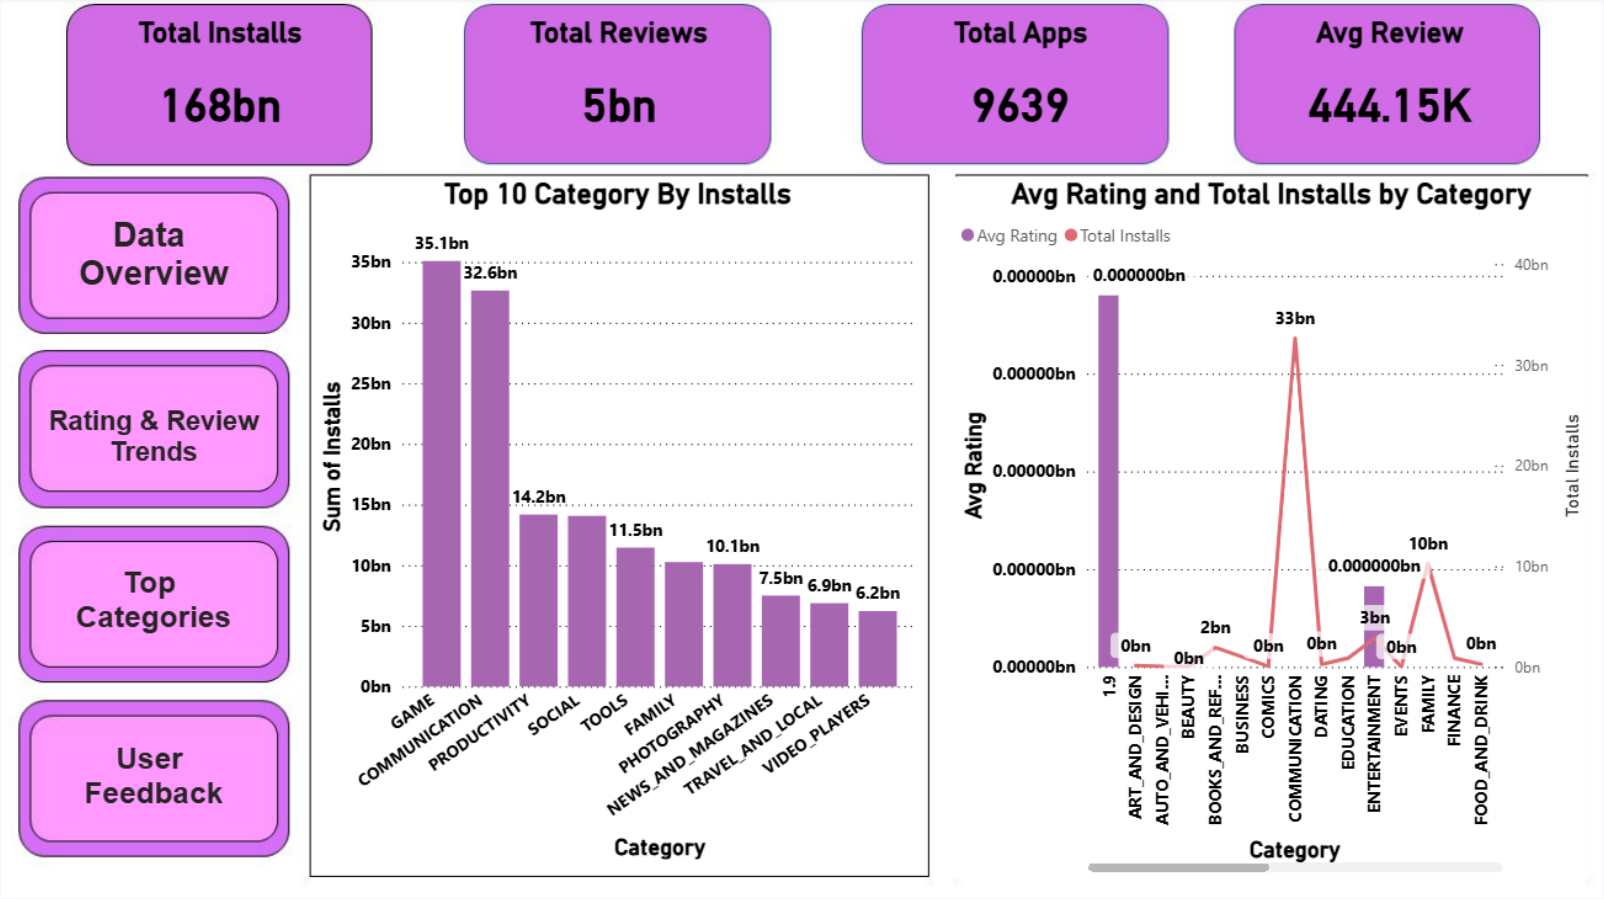

Visible finding: FAMILY leads the displayed app counts with 1,972, followed by GAME (1,144) and TOOLS (843). MEDICAL (463) and BUSINESS (460) are close in size.

Interpretation note: Counts reflect the report's aggregation. A large category indicates greater representation in this dataset; it does not establish revenue or demand.

02 / Category installs

Installation volume alongside a category-level rating comparison.

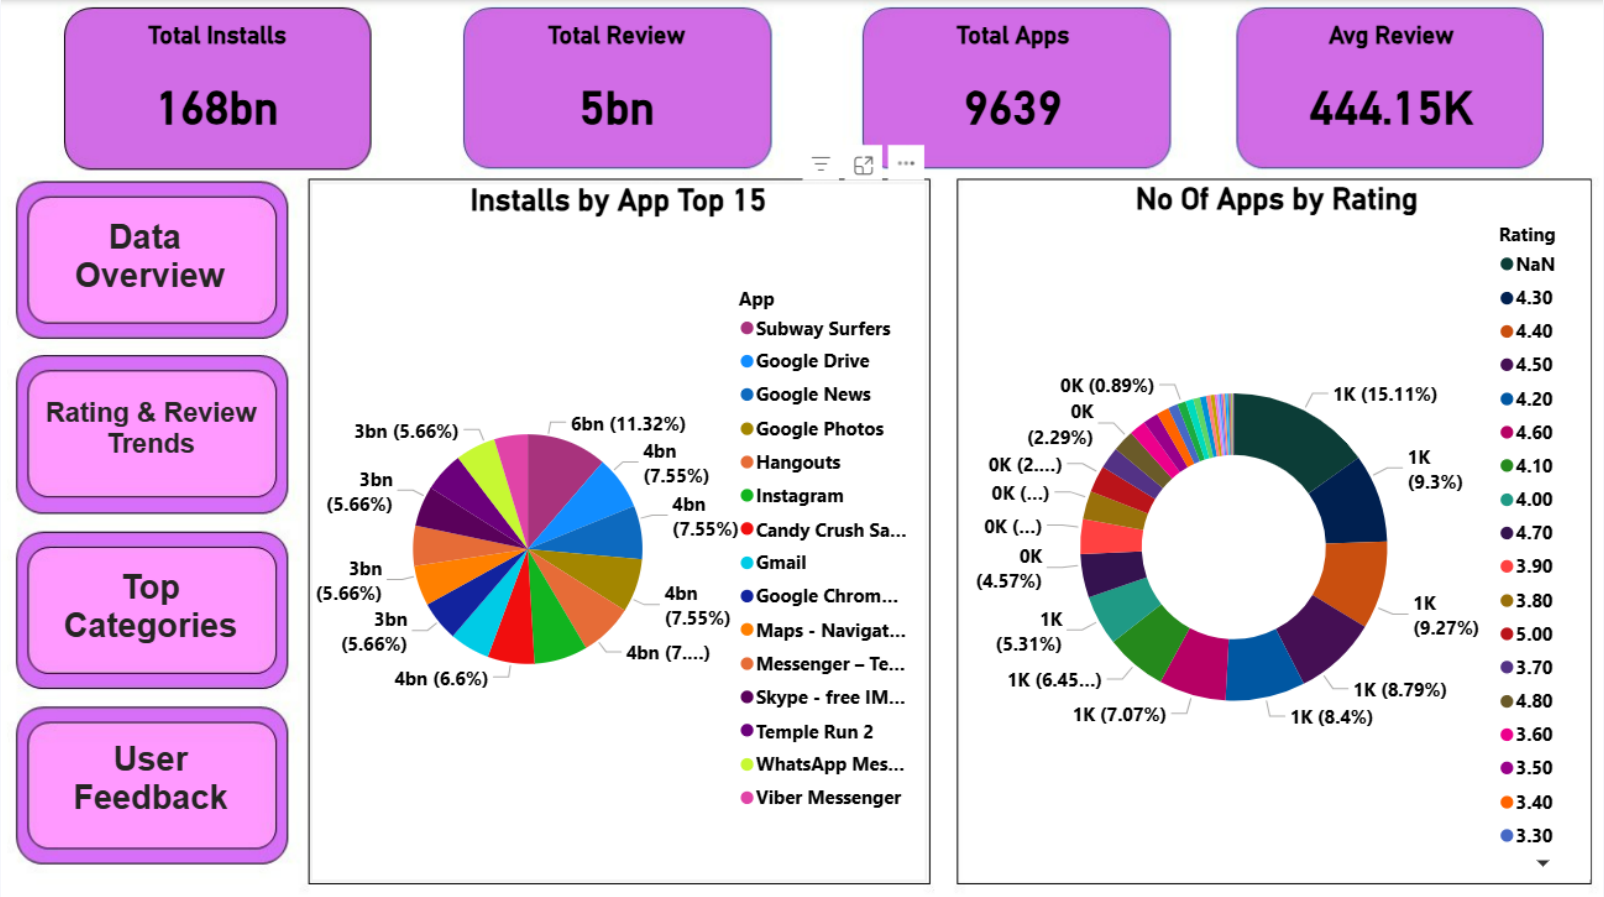

Visible finding: GAME leads the installs chart at 35.1bn, followed by COMMUNICATION at 32.6bn. TOOLS shows 11.5bn; PHOTOGRAPHY shows 10.1bn.

Interpretation note: The rating axis is formatted in billions and includes a category labeled 1.9. Validate the rating format and category values before interpreting the combination chart.

03 / Top apps and ratings

Installation shares for 15 apps and the distribution of rating values.

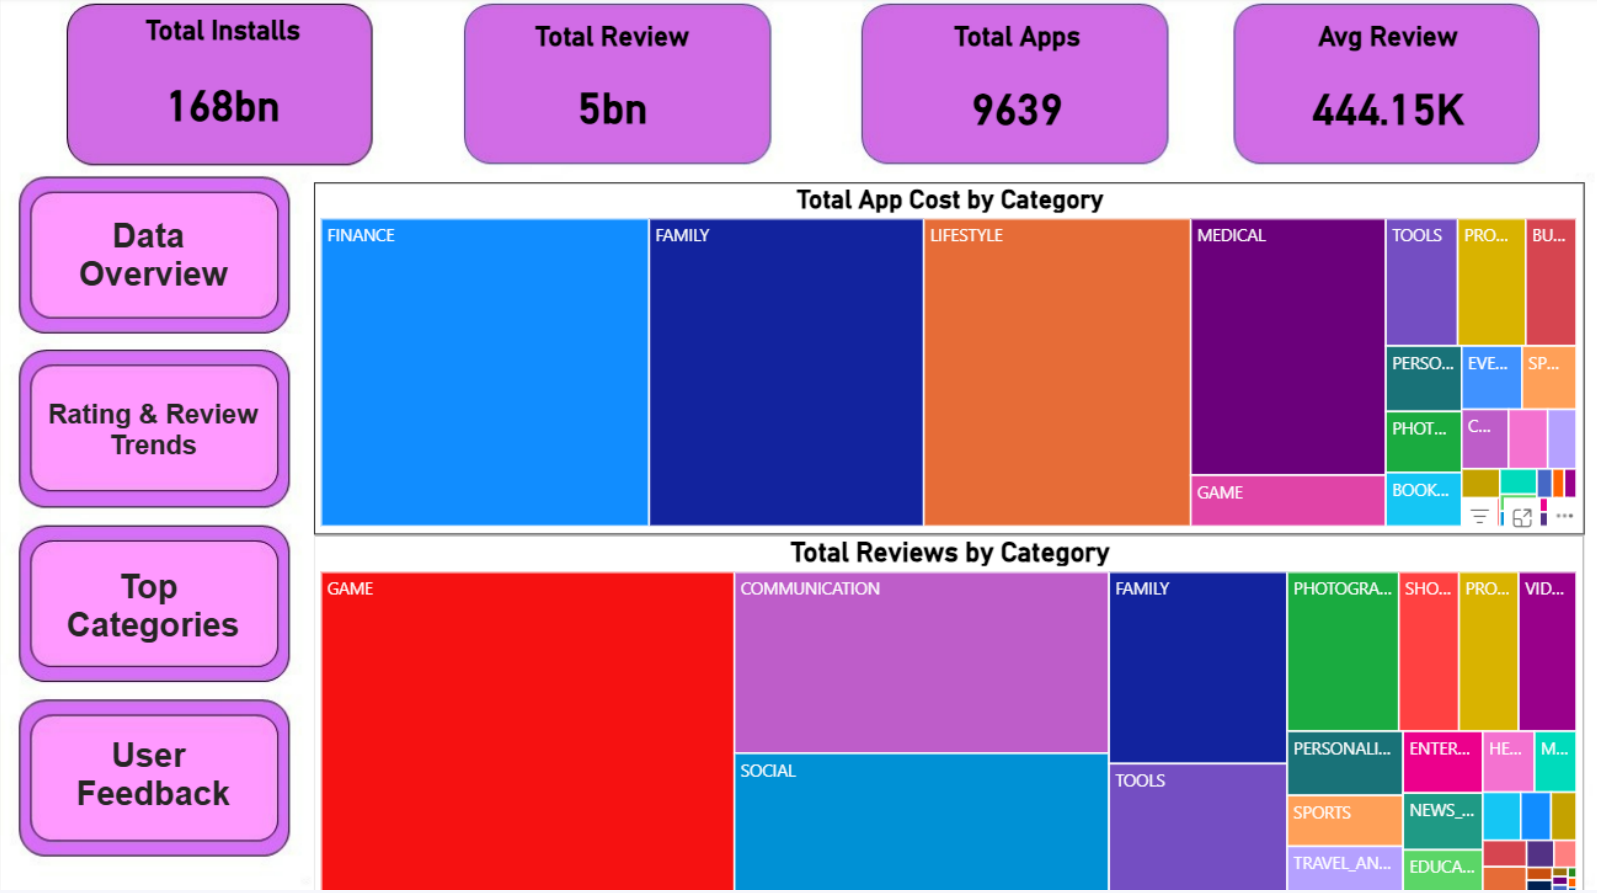

Visible finding: The top-app chart includes Subway Surfers, Google Drive, Instagram and WhatsApp. The largest visible installation slice is labeled 6bn (11.32%).

Interpretation note: The rating chart includes NaN at 15.11%. Treat this as a missing/invalid rating group pending validation. Pie percentages describe the selected top-app subset, not all installs.

04 / Cost and review mix

Treemaps show relative category contributions.

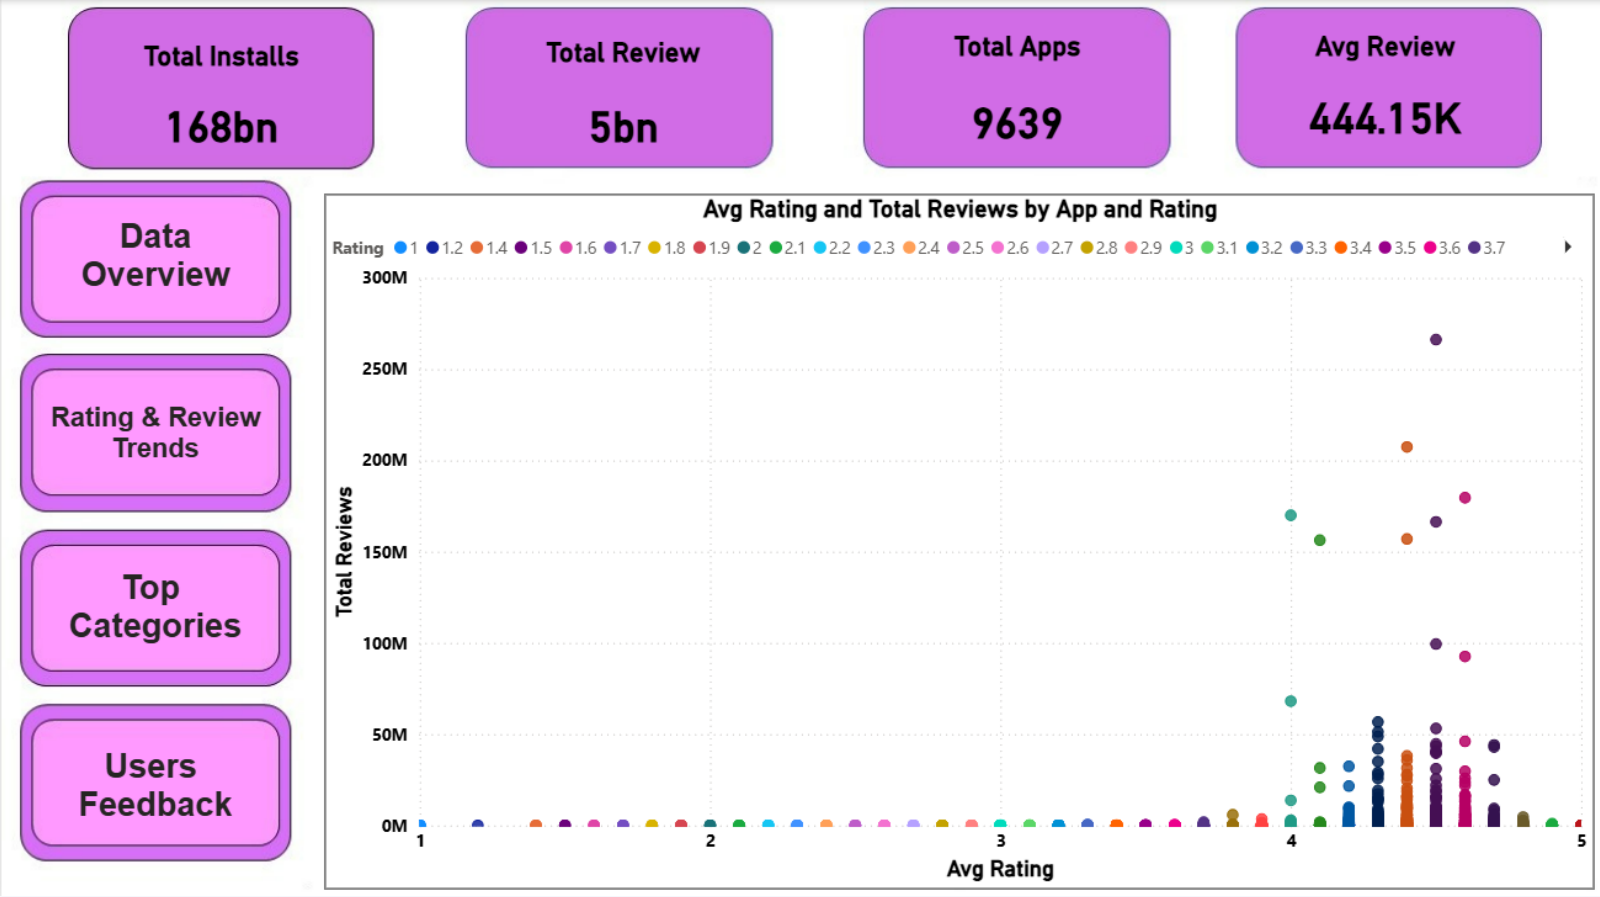

Visible finding: FINANCE, FAMILY and LIFESTYLE occupy large areas in Total App Cost. GAME has the largest visible area in Total Reviews, with COMMUNICATION and SOCIAL also prominent.

Interpretation note: Treemap labels do not provide exact values here. Total App Cost is not revenue; currency, price aggregation and outlier treatment must be verified.

05 / Ratings and reviews

A cross-sectional view of average rating and total review volume.

Visible finding: High-review observations are concentrated around ratings of 4.0 to 4.6, while many observations have low review totals across the rating range.

Interpretation note: This screenshot does not establish correlation or causation. Although the navigation says Trends, no time axis is shown, so temporal growth cannot be inferred.

Model, usage and interpretation

A practical guide for reviewing and reproducing the report.

Observed model

The supplied Power BI application view shows two tables: **Play Store Data** (22 columns) and **User Reviews** (5 columns), connected by a limited many-to-many relationship. The join key, filter direction and measure definitions have not been verified.

Open the project

1. Download the repository and open **4 project (1).pbix** in Power BI Desktop.
2. Review the five report pages and their filters.
3. To refresh, supply the original datasets and update source paths in Data source settings.
4. Validate the model and measures before relying on recalculated totals.

Validation priorities

Aggregation: check app uniqueness and duplicate records; distinguish app-level totals from review-level rows.

Relationships: test whether the many-to-many relationship affects filtering or totals. Consider a unique app dimension where appropriate.

Display: fix rating-axis units, replace NaN with an explicit missing label and use exact app counts rather than rounded 0K labels.

Scope: dataset provenance, collection date, license, refresh process and sentiment calculations remain unverified.

Evidence: five user-supplied dashboard screenshots, ordered as Overview, Category Installs, Top Apps & Ratings, Cost & Reviews, and Ratings vs Reviews; plus the supplied Power BI application description. This PDF documents the visible report and is not a native export of the PBIX file.
